HartTools 7.6

The new software is ready for download.

### HartTools 7.6 is running on Windows 11.

Hart Tools is a set of software components written for **HART device developers** and **users**. One central module is a ***Native DLL*** for the communication services, which uses very basic ***Windows API Functions***. This provides a very ***high reliability***. A typical application is therefore also software and firmware testing for **continuous integration**.

Most examples of the package are available in ***VS 2019***. One special example is showing the usage in ***VS Code***, while another one demonstrates the application in ***Python***. Applications for Microsoft ***Excel***, ***VBA*** as well as ***Office 32*** and ***Office 64*** are also included.

In addition to displaying the HART protocol, **FrameAlyst** provides the following functions:

Master/Slave Simulation, Filtering, Triggering, Encoding, Decoding, Syntax Coloring, Several Baud Rates, Printing, Save to File and Read from File.

A fully functional ***30-day trial version*** is available in: Downloads.

The ***technical descriptions*** are now summarized in one document: User Manual HartTools 7.6.

The ***major changes*** to HartTools 7.5 are listed in the Release Notes.

Coming next

- HART-IP and WirelessHART for ***FrameAlyst***
- Hart Slave Stack for ***Linux***.
